

ABSTRACT OF THE DISCLOSURE

5 In the head slider of the present invention, recording
and reproducing electrode pads and heater electrode pads
are attached to the same surface of an overcoat layer. The
heater electrode pads are located on both sides of a group
constituted by the recording and reproducing electrode pads.
As a consequence, leads for the heater are located between
respective leads for recording and reproducing head parts,
whereby crosstalk can be prevented from occurring between
10 the leads for the recording and reproducing head parts.
